INTERLOCK LEDGER

This package is a python client to the InterlockLedger Node REST API. It connects to InterlockLedger nodes, allowing the creation of chains, interlocks, and storage of records and documents.

THE INTERLOCKLEDGER

An InterlockLedger network is a peer-to-peer network of nodes. Each node runs the InterlockLedger software. All communication between nodes is point-to-point and digitally signed, but not mandatorily encrypted. This means that data is shared either publicly or on a need-to-know basis, depending on the application.

In the InterlockLedger, the ledger is composed of myriads of independently permissioned chains, comprised of blockchained records of data, under the control of their owners, but that are tied by Interlockings, that avoid them having their content/history being rewritten even by their owners. For each network the ledger is the sum of all chains in the participating nodes.

A chain is a sequential list of records, back chained with signatures/hashes to the previous records, so that no changes in them can go undetected. A record is tied to some enabled Application, that defines the metadata associate with it, and the constraints defined in this public metadata, forcibly stored in the network genesis chain, is akin to validation that each correct implementation of the node software is able to enforce, but more importantly, any external logic can validate the multiple dimensions of validity for records/chains/interlockings/the ledger.

1.1 Usage

1.1.1 How to use and/or install

To use the *interlockledger_rest* package, you can add the *interlockledger_rest* folder to your project.

The package can also be installed by running the following command on the *setup.py* folder:

```
pip3 install .
```

1.1.2 Example

How to use the *interlockledger* rest client to store a text document:

```
>>> import interlockledger_rest as il2

>>> node = il2.RestNode(cert_file = 'documenter.pfx', cert_pass='password', port = 32020)
>>> print(node.details)
Node 'Node for il2tester on Apollo' Node!qh8D-FVQ8-2ng_EIDN8C9m3pOLAtz0BXKuCh9OBD6U
Running il2 node#3.6.0 using [Message Envelope Wire Format #1] with Peer2Peer#2.1.0
Network Apollo
Color #20f9c7
Owner il2tester #Owner!yj...<REDACTED>...zk
Roles: Interlocking,Mirror,PeerRegistry,Relay,User
```

```
Chains: 20i...<REDACTED>..._fc, 5rA...<REDACTED>...Pso

>>> chain = node.chain_by_id('A1wCG9hHhuVNB8hyOALHokYsWyTumHU0vRxtcK-iDKE')
>>> doc_resp = chain.store_document_from_text(content = 'Plain text', name = 'text_
↳file.txt')
>>> print(doc_resp)
Document 'text_file.txt' [plain/text] z0F...<REDACTED>...CKQ#SHA256
```

1.2 interlockledger_rest package

1.2.1 interlockledger_rest.client module

RestChain

class `interlockledger_rest.client.RestChain` (*rest, chainId, **kwargs*)

Bases: `object`

REST API client to the InterlockLedger chain.

Note: It is not recommended to create an instance of `RestChain` outside of an instance of `RestNode`.

Parameters

- **rest** (`interlockledger_rest.models.ChainIdModel`) – Instance of the node.
- **rest** – Chain model.

id

`str` – Chain id.

name

`str` – Chain name.

active_apps

`list of int` – Enumerate apps that are currently permitted on this chain.

add_record (*model*)

Add a new record.

Parameters **model** (`interlockledger_rest.models.NewRecordModel`) – Model with the description of the new record.

Returns Added record information.

Return type `interlockledger_rest.models.RecordModel`

Example

```
>>> node = RestNode(cert_file = 'recorder.pfx', cert_pass = 'password', port_
↳= 32020)
>>> chain = node.chain_by_id('cRPeHOITV_t1ZQS9CIL7Yi3djJ33ynZCdSRsEnOvX40')
>>> model = NewRecordModel(applicationId = 1, payloadTagId = 300,
...                          payloadBytes = bytes([248, 52, 7, 5, 0, 0, 20, 2, 1, 4]))
>>> record = chain.add_record(model)
>>> print(record)
{
    "applicationId": 1,
```

```

"chainId": "cRPeHOITV_t1ZQS9CIL7Yi3djJ33ynZCdSRsEnOvX40",
"createdAt": "2020-02-13T18:59:50.9033962-03:00",
"hash": "mAwajCPHlc369GZLLXWsd_E7WkkZ2tdLS3LsZWbCPnw#SHA256",
"payloadTagId": 300,
"serial": 4,
"type": "Data",
"version": 2,
"payloadBytes": "+DQHBQAAFAIBBA=="
}

```

add_record_as_json (*applicationId=None*, *payloadTagId=None*, *payload=None*,
rec_type=<RecordType.Data: 'Data'>, *model=None*)

Add a new record with a payload encoded as JSON. The JSON value will be mapped to the payload tagged format as described by the metadata associated with the payloadTagId

Parameters

- **applicationId** (int) – Application id of the record.
- **payloadTagId** (int) – Payload tag id of the record.
- **payload** (int) – Payload data encoded as json
- **rec_type** (*interlockledger_rest.enumerations.RecordType*) – Type of record.
- **model** (*interlockledger_rest.models.NewRecordModelAsJson*) – Model with the description of the new record as JSON. **NOTE:** if model is not None, the other arguments will be ignored.

Returns Added record information.

Return type *interlockledger_rest.models.RecordModel*

Example

```

>>> node = RestNode(cert_file = 'recorder.pfx', cert_pass = 'password', port_
↳ = 32020)
>>> chain = node.chain_by_id('tdiy2HnWv-4a_h5T4Xy8l93CQ0lVkJeu2r5qgSlALMY')
>>> model = NewRecordModelAsJson(applicationId = 1, payloadTagId = 300, rec_
↳ json= {'tagId': 300, 'version' : 0, 'apps': [4]})
>>> record = chain.add_record_as_json(model = model)
>>> print(record)
{
  "applicationId": 1,
  "chainId": "tdiy2HnWv-4a_h5T4Xy8l93CQ0lVkJeu2r5qgSlALMY",
  "createdAt": "2020-02-13T18:56:44.3002447-03:00",
  "hash": "Y8Xb9FpTkgxj38xlwzcaZXm8fUq-NYxODVcyOQtzJ3c#SHA256",
  "payloadTagId": 300,
  "serial": 4,
  "type": "Data",
  "version": 2,
  "payload": {
    "tagId": 300,
    "version": 0,
    "apps": [
      4
    ]
  }
}

```

```
}  
}
```

add_record_unpacked(*applicationId*, *payloadTagId*, *rec_bytes*, *rec_type*=<RecordType.Data:
'Data'>)

Add a new record with an unpacked payload. Payload inner bytes MUST go in the body, in binary form. These inner bytes will be prefixed with the payloadTagId and the lenght, both encoded as ILInt, as required to assemble the record effective payload.

Parameters

- **applicationId** (int) – Application id of the record.
- **payloadTagId** (int) – Payload tag id of the record.
- **rec_type** (*interlockledger_rest.enumerations.RecordType*) – Type of record.
- **rec_bytes** (bytes) – Payload bytes.

Returns Added record information.

Return type *interlockledger_rest.models.RecordModel*

Example

```
>>> node = RestNode(cert_file = 'recorder.pfx', cert_pass = 'password', port_  
↳= 32020)  
>>> chain = node.chain_by_id('VzCJczfgBeIiIBlnTRbmtsPriqwrkHqtF2yt8nhTcjM')  
>>> record = chain.add_record_unpacked(applicationId = 1, payloadTagId = 300,   
↳rec_bytes = bytes([5, 0, 0, 20, 2, 1, 4]))  
>>> print(record)  
{  
    "applicationId": 1,  
    "chainId": "VzCJczfgBeIiIBlnTRbmtsPriqwrkHqtF2yt8nhTcjM",  
    "createdAt": "2020-02-13T19:01:37.5175345-03:00",  
    "hash": "cY7krS7BSJcBi7Ickq-u4iI6V6lYoKULfQtEZGJ-mC0#SHA256",  
    "payloadTagId": 300,  
    "serial": 4,  
    "type": "Data",  
    "version": 2,  
    "payloadBytes": "+DQHBQAAFAIBBA=="  
}
```

document_as_plain(*fileId*)

Retrieve document from chain as plain text.

Parameters **fileId** (str) – Unique id of the document file.

Returns Document content as a UTF-8 string.

Return type str

document_as_raw(*fileId*)

Retrieve document from chain as raw bytes.

Parameters **fileId** (str) – Unique id of the document file.

Returns Document model with content as raw bytes.

Return type *interlockledger_rest.models.RawDocumentModel*

documents

list of `interlockledger_rest.models.DocumentDetailsModel` – Enumerate documents that are stored on this chain.

force_interlock (*model*)

Forces an interlock on a target chain.

Parameters **model** (`interlockledger_rest.models.ForceInterlockModel`) – Force interlock command details.

Returns Interlocking details.

Return type `interlockledger_rest.models.InterlockingRecordModel`

Example

```
>>> node = RestNode(cert_file = 'mykeymanager.pfx', cert_pass = 'password',
↳ port = 32020)
>>> chain = node.chain_by_id('VzCJczfgBeIiIBlnTRbmtsPriqwrkHqtF2yt8nhTcjM')
>>> model = ForceInterlockModel(targetChain = '8fox30W54ZkzM-shfUeU5C7ad-_
↳ fsf5nICwNpkCUk5w')
>>> interlocks = chain.force_interlock(model)
>>> for il in interlocks :
...     print(il)
Interlocked chain 8fox30W54ZkzM-shfUeU5C7ad-_fsf5nICwNpkCUk5w at record #14
↳ (offset: 13671) with hash RyvOZIjnoUG4QX7FwQs3f6BqDfnOPb3txgXJNxLxtDo#SHA256
{
    "applicationId": 3,

↳ #SHA256",
    "interlockedRecordOffset": 13671,
    "interlockedRecordSerial": 14
}
```

interlocks

list of `interlockledger_rest.models.InterlockingRecordModel` – List of interlocks registered in the chain.

permit_apps (*apps_to_permit*)

Add apps to the permitted list for the chain.

Parameters **apps_to_permit** (list of int) – List of apps (by number) to be permitted.

Returns Enumerate apps that are currently permitted on this chain.

Return type list of int

Example

```
>>> node = RestNode(cert_file = 'recorder.pfx', cert_pass = 'password', port_
↳= 32020)
>>> chain = node.chain_by_id('AlwCG9hHhuVNB8hyOALHokYsWyTumHU0vRxtcK-iDKE')
>>> apps = chain.permit_apps([4])
>>> print(apps)
[4]
```

permit_keys (*keys_to_permit*)

Add keys to the permitted list for the chain.

Parameters **keys_to_permit** (list of `interlockledger_rest.models.KeyPermitModel`) – List of keys to permitted.

Returns Enumerate keys that are currently permitted on chain.

Return type list of `interlockledger_rest.models.KeyModel`

Example

```
>>> node = RestNode(cert_file = 'mykeymanager.pfx', cert_pass = 'password',
↳port = 32020)
>>> chain = node.chain_by_id('20ic_KPTCIDfrlwQPKBHdKKp1a6ADaFtBvBjvFmf_fc')
>>> model_1 = KeyPermitModel(app = 4, appActions = [1000, 1001], key_id =
↳'Key!MJ0kidltB324mfkiOG0aBlEocPA#SHA1',
...     name = 'documenter', publicKey = 'PubKey!KPgQEPgItqh<...
↳REDACTED...>BZk4axWhFbTDrxADAQAB#RSA',
...     purposes = [KeyPurpose.Action, KeyPurpose.Protocol])
>>> model_2 = KeyPermitModel(key_id = 'Key!aWJWFHYDmUXCTCPIW2Ugih514XQ#SHA1',

```

permitted_keys

list of `interlockledger_rest.models.KeyModel` – Enumerate keys that are currently permitted on chain.

record_at (*serial*)

Get an specific record.

Parameters **serial** (int) – Record serial number.

Returns Record with the specific serial number.

Return type `interlockledger_rest.models.RecordModel`

record_at_as_json (*serial*)

Get an specific record with payload mapped to json.

Parameters **serial** (int) – Record serial number.

Returns Record mapped to JSON with the specific serial number.

Return type `interlockledger_rest.models.RecordModelAsJson`

records

list of `interlockledger_rest.models.RecordModel` – List of records in the chain.

records_as_json

list of `interlockledger_rest.models.RecordModelAsJson` – List of records in the chain with payload mapped to JSON.

records_from (*firstSerial*, *lastSerial=None*)

Get list of records starting from a given serial number.

Parameters

- **firstSerial** (int) – Starting serial number.
- **lastSerial** (int, optional) – Last serial number.

Returns List of records in the given interval.

Return type list of `interlockledger_rest.models.RecordModel`

records_from_as_json (*firstSerial*, *lastSerial=None*)

Get list of records with payload mapped to JSON starting from a given serial number.

Parameters

- **firstSerial** (int) – Starting serial number.
- **lastSerial** (int, optional) – Last serial number.

Returns List of records mapped to JSON in the given interval.

Return type list of `interlockledger_rest.models.RecordModelAsJson`

store_document_from_bytes (*doc_bytes*, *name=None*, *content_type=None*, *model=None*)

Store document on chain using bytes.

If more details is needed to upload the document, please use a `interlockledger_rest.models.DocumentUploadModel` model.

Parameters

- **doc_bytes** (bytes) – Document bytes.
- **name** (str) – Document name (may be a file name with an extension).
- **content_type** (str) – Document content type (mime-type).
- **model** (*interlockledger_rest.models.DocumentUploadModel*) – Model with the description of the new document. **NOTE:** if model is not None, the other arguments will be ignored.

Returns Added document details.

Return type *interlockledger_rest.models.DocumentDetailsModel*

Examples

Adding a file document without specifying the name. The file name in the file_path will be used as the name of the document.

```
>>> node = RestNode(cert_file = 'documenter.pfx', cert_pass = 'password')
>>> chain = node.chain_by_id('AlwCG9hHhuVNB8hyOALHokYsWyTumHU0vRxtcK-iDKE')
>>> new_document = chain.store_document_from_bytes(doc_bytes = b'Bytes_
↳message!', name = 'bytes_file.txt', content_type = 'plain/text')
>>> print(new_document)
Document 'bytes_file.txt' [plain/text]_
↳ZegBNUskzzJRqKvIuOiuhyhJvXJ5YxMJL99ONvqkcXs#SHA256
```

Using the model to specify the description of the document.

```
>>> node = RestNode(cert_file = 'documenter.pfx', cert_pass = 'password')
>>> chain = node.chain_by_id('AlwCG9hHhuVNB8hyOALHokYsWyTumHU0vRxtcK-iDKE')
>>> model = DocumentUploadModel(name = 'other_bytes_file.txt', contentType =
↳'plain/text')
>>> new_document = chain.store_document_from_bytes(doc_bytes = b'Other bytes_
↳message!', model = model)
>>> print(new_document)
Document 'other_bytes_file.txt' [plain/text] wLQypXsHLV0H7RdNrrM3NvViA7W1-
↳9pcClPgWGMmF6Q#SHA256
```

store_document_from_file (file_path, content_type=None, name=None, model=None)

Store document on chain using a file.

If more details is needed to upload the document, please use a *interlockledger_rest.models.DocumentUploadModel* model.

Parameters

- **file_path** (bytes) – Filepath of the document file.
- **content_type** (str) – Document content type (mime-type).
- **name** (str, optional) – Document name (may be a file name with an extension). Can be derived from the file_path.
- **model** (*interlockledger_rest.models.DocumentUploadModel*) – Model with the description of the new document. **NOTE:** if model is not None, the other arguments will be ignored.

Returns Added document details.

Return type `interlockledger_rest.models.DocumentDetailsModel`

Examples

Adding a file document without specifying the name. The file name in the file_path will be used as the name of the document.

```
>>> node = RestNode(cert_file = 'documenter.pfx', cert_pass = 'password')
>>> chain = node.chain_by_id('AlwCG9hHhuVNB8hyOALHokYsWyTumHU0vRxtcK-iDKE')
>>> new_document = chain.store_document_from_file(file_path = './test.pdf',
↳ content_type = 'application/pdf')
>>> print(new_document)
Document 'test.pdf' [application/pdf] tZpQvucMOi-
↳ FYHNQvI9UaOampVCUPtw3m0Z5TXwuF20#SHA256
```

Using the model to specify the description of the document.

```
>>> node = RestNode(cert_file = 'documenter.pfx', cert_pass = 'password')
>>> chain = node.chain_by_id('AlwCG9hHhuVNB8hyOALHokYsWyTumHU0vRxtcK-iDKE')
>>> model = DocumentUploadModel(name = 'my_test.txt', contentType = 'plain/
↳ text', cipher = CipherAlgorithms.AES256)
>>> new_document = chain.store_document_from_file(file_path = './test.txt',
↳ model = model)
>>> print(new_document)
Document 'my_test.txt' [plain/text] FukEk1l0cTDSp4k4zJehM--5ZzzjMz-
↳ LVeAsSeaMIeeg#SHA256
```

store_document_from_text (content, name, content_type='plain/text')

Store document on chain using bytes.

If more details is needed to upload the document, please use a `interlockledger_rest.models.DocumentUploadModel` model.

Parameters

- **doc_bytes** (bytes) – Document bytes.
- **content_type** (str) – Document content type (mime-type).
- **name** (str, optional) – Document name (may be a file name with an extension). Can be derived from the file_path.
- **model** (`interlockledger_rest.models.DocumentUploadModel`) – Model with the description of the new document. **NOTE:** if model is not None, the other arguments will be ignored.

Returns Added document details.

Return type `interlockledger_rest.models.DocumentDetailsModel`

Example

```
>>> node = RestNode(cert_file = 'documenter.pfx', cert_pass = 'password')
>>> chain = node.chain_by_id('AlwCG9hHhuVNB8hyOALHokYsWyTumHU0vRxtcK-iDKE')
>>> new_document = chain.store_document_from_text(content = 'Simple text',
↳ name = 'document.txt')
>>> print(new_document)
Document 'document.txt' [plain/text] d_G2-zQ05L5QZ-
↳ omHi7cfyJWiSes4xovJuFoOUNnxNo#SHA256
```

summary

interlockledger_rest.models.ChainSummaryModel – Chain details

RestNetwork

class *interlockledger_rest.client.RestNetwork*(*rest*)

Bases: object

Informations about the node network.

Parameters *rest* (*RestNode*) – Node of the network.

apps

AppsModel – List of valid apps in the network.

RestNode

class *interlockledger_rest.client.RestNode*(*cert_file*, *cert_pass*, *port*=32032, *address*='localhost')

Bases: object

REST API client to the InterlockLedger node.

You'll try to establish a bi-authenticated https connection with the configured node API address and port. The client-side certificate used to connect needs to be configured with the proper layered authorization role in the node configuration file and imported into a key permitted to update the chain that will be used.

Parameters

- **cert_file** (*str*) – Path to the .pfx certificate. Please refer to the InterlockLedger manual to see how to create and import the certificate into the node.
- **cert_pass** (*str*) – Password of the .pfx certificate.
- **port** (*int*) – Port number to connect.
- **address** (*str*) – Address of the node.

base_uri

uri.URI – The base URI address of the node.

network

RestNetwork – Network information client.

add_mirrors_of (*new_mirrors*)

Add new mirrors in this node.

Parameters *new_mirrors* (*list of str*) – List of mirrors chain ids.

Returns List of the chain information.

Return type *list of interlockledger_rest.models.ChainIdModel*

certificate_name

str – Certificate friendly name.

chain_by_id (*chain_id*)

Get a chain by id.

Parameters *chain_id* (*str*) – Chain id.

Returns Chain instance with the corresponding id.

Return type *RestChain*

Example

```
>>> node = RestNode(cert_file = 'documenter.pfx', cert_pass = 'password',
↳port = 32020)
>>> chain = node.chain_by_id('AlwCG9hHhuVNB8hyOALHokYsWyTumHU0vRxtcK-iDKE')
>>> print(chain)
Chain '3.6.2 chain name' #AlwCG9hHhuVNB8hyOALHokYsWyTumHU0vRxtcK-iDKE
```

chains

list of *RestChain* – List of chain instances.

create_chain(model)

Create a new chain.

Parameters **model** (*interlockledger_rest.models.ChainCreationModel*) – Model with the new chain attributes.

Returns Chain created model.

Return type *interlockledger_rest.models.ChainCreatedModel*

Example

```
>>> node = RestNode(cert_file = 'admin.pfx', cert_pass = 'password', port =
↳32020)
>>> new_chain = ChainCreationModel(name = 'New chain name', description =
↳'New chain',
...                               managementKeyPassword = 'keyPassword',
↳emergencyClosingKeyPassword = 'closingPassword')
>>> resp = node.create_chain(new_chain)
>>> print(resp)
Chain 'New chain name' #cRPeHOITV_t1ZQS9CIL7Yi3djJ33ynZCdSRsEnOvX40
```

details

interlockledger_rest.models.NodeDetailsModel – Get node details.

interlocks_of(chain)

Get the list of interlocking records pointing to a target chain instance.

Parameters **chain** (str) – Chain id.

Returns List of interlockings.

Return type list of *interlockledger_rest.models.InterlockingRecordModel*

Example

```
>>> node = RestNode(cert_file = 'documenter.pfx', cert_pass = 'password')
>>> interlocks = node.interlocks_of('8fox30W54ZkzM-shfUeU5C7ad-
↳fsf5nICwNpkCUk5w')
>>> for interlock in interlocks :
```

```
...     print(interlock)
Interlocked chain 8fox30W54ZkzM-shfUeU5C7ad-_fsf5nICwNpkCUk5w at record #14_

mirrors

list of *RestChain* – Get list of mirrors instances.

peers

list of *interlockledger_rest.models.PeerModel* – Get list of known peers.

1.2.2 interlockledger_rest.models module

CustomEncoder

```
class interlockledger_rest.models.CustomEncoder (*, skipkeys=False, ensure_ascii=True,
                                                    check_circular=True,
                                                    low_nan=True,      sort_keys=False,
                                                    indent=None,      separators=None,
                                                    default=None)
```

Bases: `json.encoder.JSONEncoder`

Custom JSON encoder for the IL2 REST API models.

default (*obj*)

Set the behavior of the encoder depending on the type of obj.

BaseModel

```
class interlockledger_rest.models.BaseModel
```

Bases: `object`

Base class for all models.

classmethod from_json (*json_data*)

Convert a dict (JSON like) to a *BaseModel* object.

Parameters *json_data* (dict) – JSON object to be converted.

Returns return an instance of the JSON model.

Return type *BaseModel*

json (*hide_null=True, return_as_str=False*)

Convert a BaseModel class to a dict (JSON like).

Parameters

- **hide_null** (bool, optional) – If True, discards every item (key, value) where value is None.
- **return_as_str** (bool, optional) – If True, return the JSON as a string instead of a dict.

Returns return obj as a JSON

Return type dict/str

classmethod to_json (*obj, hide_null=True, return_as_str=False*)

Convert an object to a dict (JSON like).

Parameters

- **obj** (list/dict/*BaseModel*) – Object to be converted to JSON.
- **hide_null** (bool, optional) – If True, discards every item (key, value) where value is None.
- **return_as_str** (bool, optional) – If True, return the JSON as a string instead of a dict.

Returns return obj as a JSON

Return type dict/str

AppsModel

class `interlockledger_rest.models.AppsModel` (*network=None, validApps=[], **kwargs*)

Bases: `interlockledger_rest.models.BaseModel`

Details of the InterlockApps available in the chain.

Parameters

- **network** (str) – Network name.
- **validApps** (list of *PublishedApp*/list of dict) – List of currently valid apps for this network.
- ****kwargs** – Arbitrary keyword arguments.

network

str – Network name

validApps

list of *PublishedApp* – Currently valid apps for this network

class PublishedApp (*alternativeId=None, appVersion=None, description=None, app_id=None, name=None, publisherId=None, dataModels=None, publisherName=None, reservedILTagIds=None, simplifiedHashCode=None, start=None, version_=None, **kwargs*)

Bases: `interlockledger_rest.models.BaseModel`

InterlockApp permitted in the chain.

alternativeId
int

appVersion
version – Application semantic version, with four numeric parts.

description
str – Description of the application.

id
int – Unique id for the application.

name
str – Application name.

publisherId
str – Publisher id, which is the identifier for the key the publisher uses to sign the workflow requests in its own chain. It should match the PublisherName

publisherName
str – Publisher name as registered in the Genesis chain of the network.

reservedILTagIds
list of `interlockledger_rest.util.LimitedRange` – The list of ranges of ILTagIds to reserve for the application.

simplifiedHashCode
int – The start date for the validity of the app, but if prior to the effective publication of the app will be overridden with the publication date and time.

start
`datetime.datetime` – The start date for the validity of the app, but if prior to the effective publication of the app will be overridden with the publication date and time.

version
int

__eq__(*other*)
bool: Return True if self and other have the same id and appVersion.

__lt__(*other*)
bool: Return self.id < other.id. If self and other have the same id, return self.appVersion < other.appVersion.

__str__()
str: String representation of the published app.

compositeName
str – Concatenation of the App's publisher name, name and version.

AppPermissions

```
class interlockledger_rest.models.AppPermissions (appId=None,          actionIds=[],
                                                  **kwargs)
    Bases: interlockledger_rest.models.BaseModel
    App permissions
    appId
        int – App to be permitted (by number)
```

actionIds

list of int – App actions to be permitted by number.

__str__()

str: String representation of app permissions.

classmethod from_str (permissions)

Parse a string into an *AppPermissions* object.

Parameters **permissions** (str) – App permissions in the format used by the JSON response ('#<appId>,<actionId_1>,...,<actionId_n>').

Returns return an *AppPermissions* instance.

Return type *AppPermissions*

to_str()

str: String representation of app permissions in the JSON format ('#<appId>,<actionId_1>,...,<actionId_n>').

DataModel

```
class interlockledger_rest.models.DataModel (description=None, dataFields=None,
                                              indexes=None, payloadName=None, payloadTagId=None, version=None, **kwargs)
```

Bases: *interlockledger_rest.models.BaseModel*

Data model

description

str – Description of the data model.

dataFields

list of *DataModel.DataFieldModel* – TODO

indexes

list of *DataModel.DataIndexModel* – List of indexes for records of this type.

payloadName

str – Name of the record model.

payloadTagId

int – Tag id for this payload type. It must be a number in the reserved ranges.

version

int – Version of this data model, should start from 1.

```
class DataFieldModel (cast=None, elementTagId=None, isOpaque=None, isOptional=None,
                      description=None, Enumeration=None, enumerationAsFlags=None,
                      name=None, serializationVersion=None, subDataFields=None,
                      tagId=None, version=None, **kwargs)
```

Bases: *interlockledger_rest.models.BaseModel*

Data field

cast

interlockledger_rest.enumerations.DataFieldCast – TODO

elementTagId

int – TODO

isOpaque

bool – TODO

```
isOptional
    bool - TODO

name
    str - TODO

serializationVersion
    int - TODO

subDataFields
    list of DataModel.DataFieldModel - TODO

tagId
    int - TODO

version
    int - TODO

class DataIndexModel (elements=None, isUnique=None, name=None, **kwargs)
    Bases: interlockledger_rest.models.BaseModel

    Data index

    elements
        list of DataModel.DataIndexModel.DataIndexElementModel - TODO

    isUnique
        bool - TODO

    name
        str - TODO

class DataIndexElementModel (descendingOrder=None, fieldPath=None, function=None,
                                **kwargs)
    Bases: interlockledger_rest.models.BaseModel

    Data index element

    descendingOrder
        bool - TODO

    fieldPath
        str - TODO

    function
        str - TODO
```

ExportedKeyFile

```
class interlockledger_rest.models.ExportedKeyFile (keyFileBytes=None, keyFile-
                                                    Name=None, keyName=None,
                                                    **kwargs)

    Bases: interlockledger_rest.models.BaseModel

    Key file info.

    keyFileBytes
        bytes - TODO

    keyFileName
        str - TODO
```

keyName
str – TODO

ChainIdModel

```
class interlockledger_rest.models.ChainIdModel (chain_id=None,      name=None,
                                              **kwargs)
    Bases: interlockledger_rest.models.BaseModel
    Chain Id
    id
        str – Unique record id
    name
        str – Chain name
    __eq__ (other)
        bool: Return self.id == other.id.
    __hash__ ()
        int: Hash representation of self.
    __lt__ (other)
        bool: Return self.id < other.id.
    __str__ ()
        str: String representation of the ChainIdModel.
```

ChainCreatedModel

```
class interlockledger_rest.models.ChainCreatedModel (chain_id=None,  name=None,
                                                    keyFiles=[], **kwargs)
    Bases: interlockledger_rest.models.ChainIdModel
    Chain created response.
    id
        str – Unique record id.
    keyFiles
        list of ExportedKeyFile – Emergency key file names.
    name
        str – Chain name.
```

ChainCreationModel

```
class interlockledger_rest.models.ChainCreationModel (name, emergencyClosingKeyPassword, managementKeyPassword, additionalApps=None, description=None, emergencyClosingKeyStrength=<KeyStrength.ExtraStrong: 'ExtraStrong'>, managementKeyStrength=<KeyStrength.Strong: 'Strong'>, keysAlgorithm=<Algorithms.RSA: 'RSA'>, operatingKeyStrength=<KeyStrength.Normal: 'Normal'>, parent=None, **kwargs)
```

Bases: `interlockledger_rest.models.BaseModel`

Chain creation parameters.

additionalApps

list of int – List of additional apps (only numeric ids).

description

str – Description (perhaps intended primary usage).

emergencyClosingKeyPassword

str – Emergency closing key password.

emergencyClosingKeyStrength

`interlockledger_rest.enumerations.KeyStrength` – Emergency closing key strength of key.

managementKeyPassword

str – Key management key password.

managementKeyStrength

`interlockledger_rest.enumerations.KeyStrength` – Key management strength of key.

keysAlgorithm

`interlockledger_rest.enumerations.Algorithms` – Keys algorithm.

name

str – Name of the chain.

operatingKeyStrength

`interlockledger_rest.enumerations.KeyStrength` – Operating key strength of key.

parent

str – Parent record Id.

ChainSummaryModel

```
class interlockledger_rest.models.ChainSummaryModel (chain_id=None, name=None, activeApps=[], description=None, isClosedForNewTransactions=False, lastRecord=None, **kwargs)
```

Bases: `interlockledger_rest.models.ChainIdModel`

Chain summary.

activeApps

list of int – List of active apps (only the numeric ids).

description

str – Description (perhaps intended primary usage).

isClosedForNewTransactions

bool – Indicates if the chain accepts new records.

lastRecord

int – Serial number of the last record.

DocumentBaseModel

```
class interlockledger_rest.models.DocumentBaseModel (cipher=<CipherAlgorithms.NONE:
                                                    'None'>,      keyId=None,
                                                    name=None,      previousVer-
                                                    sion=None, **kwargs)
```

Bases: `interlockledger_rest.models.BaseModel`

Document base model.

cipher

`interlockledger_rest.enumerations.CipherAlgorithms` – Cipher algorithm used to cipher the document.

keyId

str – Unique id of key that ciphers this document.

name

str – Document name, may be a file name with an extension.

previousVersion

str – A reference to a previous version of this document (ChainId and RecordNumber).

is_ciphersed

(bool) – Return True if the document is ciphered.

DocumentDetailsModel

```
class interlockledger_rest.models.DocumentDetailsModel (cipher=<CipherAlgorithms.NONE:
                                                    'None'>,      keyId=None,
                                                    name=None,      previousVer-
                                                    sion=None,      content-
                                                    Type=None,      fileId=None,
                                                    physicalDocumen-
                                                    tID=None, **kwargs)
```

Bases: `interlockledger_rest.models.DocumentBaseModel`

Document details.

contentType

str – Document content type (mime-type).

fileId

str – Unique id of the document derived from its content. The same content stored in different chains will have the same FileId.

physicalDocumentID

`str` – Compound id for this document as stored in this chain.

__str__()

(`str`): String representation of the document: 'Document '{name}' [{contentType}] {fileId}'.

is_plain_text

(`bool`) – Return True if the content type is plain/text.

DocumentUploadModel

```
class interlockledger_rest.models.DocumentUploadModel (cipher=<CipherAlgorithms.NONE:
                                                         'None'>,      keyId=None,
                                                         name=None,    previousVer-
                                                         sion=None,      content-
                                                         Type=None, **kwargs)
```

Bases: `interlockledger_rest.models.DocumentBaseModel`

Document model used to upload/post documents in the chain.

contentType

`str` – Document content type (mime-type).

to_query_string

(`str`) – Request query representation.

RawDocumentModel

```
class interlockledger_rest.models.RawDocumentModel (contentType=None,      con-
                                                         tent=None,      name=None,
                                                         **kwargs)
```

Bases: `interlockledger_rest.models.BaseModel`

Document as raw data.

Parameters

- **contentType** (`str`) – Document content type (mime-type).
- **content** (`bytes/bytes`) – Content of the document in raw bytes. If loaded from JSON, can be input as a base64 string which will be decoded to bytes.
- **name** (`str`) – Document name, may be a file name with an extension.

contentType

`str` – Document content type (mime-type).

content

`bytes` – Content of the document in raw bytes.

name

`str` – Document name, may be a file name with an extension.

ForceInterlockModel

```
class interlockledger_rest.models.ForceInterlockModel (hashAlgorithm=<HashAlgorithms.SHA256:
                                                         'SHA256'>, minSe-
                                                         rial=0, targetChain=None,
                                                         **kwargs)
```

Bases: *interlockledger_rest.models.BaseModel*

Force interlock command details.

hashAlgorithm

interlockledger_rest.enumerations.HashAlgorithms – Hash algorithm to use.

minSerial

int – Required minimum of the serial of the last record in target chain whose hash will be pulled.

targetChain

str – Id of chain to be interlocked.

__str__()

(str): String representation of the interlock.

KeyModel

```
class interlockledger_rest.models.KeyModel (key_id=None, name=None, permis-
                                             sions=None, publicKey=None, pur-
                                             poses=None, **kwargs)
```

Bases: *interlockledger_rest.models.BaseModel*

Key model

Parameters

- **key_id** (str) – Unique key id.
- **name** (str) – Key name.
- **permissions** (list of *AppPermissions*) – List of Apps and Corresponding Actions to be permitted by numbers.
- **publicKey** (str) – Key public key.
- **purposes** (list of *interlockledger_rest.enumerations.KeyPurpose*/str) – Key valid purposes.
- ****kwargs** – Arbitrary keyword arguments.

id

str – Unique key id.

name

str – Key name.

permissions

list of *AppPermissions* – List of Apps and Corresponding Actions to be permitted by numbers.

publicKey

str – Key public key.

purposes

list of *interlockledger_rest.enumerations.KeyPurpose*/str – Key valid purposes.

__str__()
(str): String representation of the key details.

actionable
(bool) – Return True if ‘Action’ is in the list of purposes.

KeyPermitModel

```
class interlockledger_rest.models.KeyPermitModel (key_id=None, name=None, permis-
                                                    sions=None,      publicKey=None,
                                                    purposes=[],   app=None,   ap-
                                                    pActions=None, **kwargs)
```

Bases: *interlockledger_rest.models.BaseModel*

Key to permit.

Parameters

- **key_id** (str) – Unique key id.
- **name** (str) – Key name.
- **permissions** (list of *AppPermissions*) – List of Apps and Corresponding Actions to be permitted by numbers.
- **publicKey** (str) – Key public key.
- **purposes** (list of *interlockledger_rest.enumerations.KeyPurpose*/str) – Key valid purposes.
- **app** (int) – App to be permitted (by number). *Note:* If app and appActions is passed as parameter, permissions parameter will be ignored.
- **appActions** (list of int) – App actions to be permitted by number. *Note:* If app and appActions is passed as parameter, permissions parameter will be ignored.
- ****kwargs** – Arbitrary keyword arguments.

id
str – Unique key id.

name
str – Key name.

permissions
list of *AppPermissions* – List of Apps and Corresponding Actions to be permitted by numbers.

publicKey
str – Key public key.

purposes
list of *interlockledger_rest.enumerations.KeyPurpose*/str – Key valid purposes.

NewRecordModelBase

```
class interlockledger_rest.models.NewRecordModelBase (applicationId=None,
                                                         rec_type=<RecordType.Data:
                                                         'Data'>, **kwargs)
```

Bases: *interlockledger_rest.models.BaseModel*

Base model for new Record.

applicationId

int – Application id this record is associated with.

rec_type

interlockledger_rest.enumerations.RecordType – Block type. Most records are of the type 'Data'. Corresponds to the 'type' field in the JSON.

NewRecordModelAsJson

```
class interlockledger_rest.models.NewRecordModelAsJson (applicationId=None,
                                                         rec_type=<RecordType.Data:
                                                         'Data'>, rec_json=None,
                                                         payloadTagId=None,
                                                         **kwargs)
```

Bases: *interlockledger_rest.models.NewRecordModelBase*

New record model to be added to the chain as a JSON.

json

dict – The payload data matching the metadata for PayloadTagId.

payloadTagId

interlockledger_rest.enumerations.RecordType – The tag id for the payload, as registered for the application.

to_query_string

(str) – Request query representation.

NewRecordModel

```
class interlockledger_rest.models.NewRecordModel (applicationId=None,
                                                    rec_type=<RecordType.Data:
                                                    'Data'>, payloadBytes=None,
                                                    **kwargs)
```

Bases: *interlockledger_rest.models.NewRecordModelBase*

New record model to be added to the chain as raw bytes.

payloadBytes

dict – The payload in bytes. Must match the bytes schema of the application Id.

NodeCommonModel

```
class interlockledger_rest.models.NodeCommonModel (color=None, node_id=None,
                                                    name=None, network=None,
                                                    ownerId=None, ownerName=None,
                                                    roles=None, softwareVer-
                                                    sions=None, **kwargs)
```

Bases: *interlockledger_rest.models.BaseModel*

Node/Peer common details

color

Color – Mapping color.

id

str – Unique node id

name
str – Node name.

network
str – Network this node participates on.

ownerId
str – Node owner id

ownerName
str – Node owner name.

roles
list of str – List of active roles running in the node

softwareVersions
Versions – Version of software running the Node.

fancy_color
(str) – Return the color as its name or the corresponding hexadecimal values.

NodeDetailsModel

```
class interlockledger_rest.models.NodeDetailsModel (color=None, node_id=None,
                                                    name=None, network=None,
                                                    ownerId=None, owner-
                                                    Name=None, roles=None, soft-
                                                    wareVersions=None, chains=[],

```

Bases: *interlockledger_rest.models.NodeCommonModel*

Node details

chains
list of str – List of owned records, only the ids

PeerModel

```
class interlockledger_rest.models.PeerModel (color=None, node_id=None, name=None,
                                              network=None, ownerId=None, owner-
                                              Name=None, roles=None, softwareVer-
                                              sions=None, address=None, port=None,
                                              protocol=None, **kwargs)
```

Bases: *interlockledger_rest.models.NodeCommonModel*

Peer details.

address
str – Network address to contact the peer.

port
int – Port the peer is listening.

protocol
interlockledger_rest.enumerations.NetworkProtocol – Network protocol the peer is listening.

RecordModelBase

```
class interlockledger_rest.models.RecordModelBase (applicationId=None,
                                                    chainId=None,   createdAt=None,
                                                    rec_hash=None,     payload-
                                                    TagId=None,       serial=None,
                                                    rec_type=None,    version=None,
                                                    **kwargs)
```

Bases: `interlockledger_rest.models.BaseModel`

Base model for records.

Parameters

- **applicationId** (`int`) – Application id this record is associated with.
- **chainId** (`str`) – Chain id that owns this record.
- **createdAt** (`datetime.datetime`) – Time of record creation.
- **rec_hash** (`str`) – Hash of the full encoded bytes of the record.
- **payloadTagId** (`int`) – The payload’s TagId.
- **serial** (`int`) – Block serial number. For the first record this value is zero (0).
- **rec_type** (`interlockledger_rest.enumerations.RecordType`) – Block type. Most records are of the type ‘Data’. Corresponds to the ‘type’ field in the JSON.
- **version** (`int`) – Version of this record structure.

applicationId

`int` – Application id this record is associated with.

chainId

`str` – Chain id that owns this record.

createdAt

`datetime.datetime` – Time of record creation.

hash

`str` – Hash of the full encoded bytes of the record.

payloadTagId

`int` – The payload’s TagId.

serial

`int` – Block serial number. For the first record this value is zero (0).

type

`interlockledger_rest.enumerations.RecordType` – Block type. Most records are of the type ‘Data’. Corresponds to the ‘type’ field in the JSON.

version

`int` – Version of this record structure.

__str__()

(`str`): JSON representation of the record as string.

RecordModel

```
class interlockledger_rest.models.RecordModel (applicationId=None,      chainId=None,
                                              createdAt=None,      rec_hash=None,
                                              payloadTagId=None,      serial=None,
                                              rec_type=None, version=None, payload-
                                              Bytes=None, **kwargs)
```

Bases: `interlockledger_rest.models.RecordModelBase`

Generic opaque record.

Parameters **payloadBytes** (bytes/str) – The payload’s bytes. If loaded from JSON, can be input as a base64 string which will be decoded to bytes.

payloadBytes
bytes – The payload’s bytes.

RecordModelAsJson

```
class interlockledger_rest.models.RecordModelAsJson (applicationId=None,
                                              chainId=None, createdAt=None,
                                              rec_hash=None,      payload-
                                              TagId=None,      serial=None,
                                              rec_type=None, version=None,
                                              payload=None, **kwargs)
```

Bases: `interlockledger_rest.models.RecordModelBase`

Record model as JSON.

payload
Payload bytes.

InterlockingRecordModel

```
class interlockledger_rest.models.InterlockingRecordModel (applicationId=None,
                                              chainId=None,
                                              createdAt=None,
                                              rec_hash=None, pay-
                                              loadTagId=None,
                                              serial=None,
                                              rec_type=None,
                                              version=None, pay-
                                              loadBytes=None, inter-
                                              lockedChainId=None,
                                              interlockedRecord-
                                              Hash=None, interlocke-
                                              dRecordOffset=None,
                                              interlockedRecordSe-
                                              rial=None, **kwargs)
```

Bases: `interlockledger_rest.models.RecordModel`

Interlocking details.

interlockedChainId
str – Interlocked Chain.

```

interlockedRecordHash
    str – Interlock Record Hash.

interlockedRecordOffset
    int – Interlocked Record Offset.

interlockedRecordSerial
    int – Interlocked Record Serial.

__str__()
    (str): String representation.

```

Versions

```

class interlockledger_rest.models.Versions (coreLibs=None, messageEnvelopeWireFormat=None, node=None, peer2peer=None,
                                             **kwargs)

Bases: interlockledger_rest.models.BaseModel

Versions for parts of the software.

coreLibs
    str – Core libraries and il2apps version.

messageEnvelopeWireFormat
    str – Message envelope wire format version.

node
    str – Interlockledger node daemon version.

peer2peer
    str – Peer2Peer connectivity library version.

```

1.2.3 interlockledger_rest.enumerations module

Algorithms

```

class interlockledger_rest.enumerations.Algorithms
    Bases: interlockledger_rest.enumerations.AutoName

    Enumeration of the digital signature algorithms available in IL2.

    DSA = 'DSA'

    EcDSA = 'EcDSA'

    EdDSA = 'EdDSA'

    ElGamal = 'ElGamal'

    RSA = 'RSA'

    RSA15 = 'RSA15'

```

AutoName

```

class interlockledger_rest.enumerations.AutoName
    Bases: enum.Enum

    Base Enum class to automatically generate the enumerations values based on the enumeration name.

```

DataFieldCast

```
class interlockledger_rest.enumerations.DataFieldCast
    Bases: interlockledger_rest.enumerations.AutoName
    Enumeration of casting options for DataField
    DateTime = 'DateTime'
    Integer = 'Integer'
    NONE = 'None'
    TimeSpan = 'TimeSpan'
```

CipherAlgorithms

```
class interlockledger_rest.enumerations.CipherAlgorithms
    Bases: interlockledger_rest.enumerations.AutoName
    Enumeration of the cipher algorithms available in IL2.
    AES256 = 'AES256'
    NONE = 'None'
```

HashAlgorithms

```
class interlockledger_rest.enumerations.HashAlgorithms
    Bases: interlockledger_rest.enumerations.AutoName
    Enumeration of the hash algorithms available in IL2.
    Copy = 'Copy'
    SHA1 = 'SHA1'
    SHA256 = 'SHA256'
    SHA3_256 = 'SHA3_256'
    SHA3_512 = 'SHA3_512'
    SHA512 = 'SHA512'
```

KeyPurpose

```
class interlockledger_rest.enumerations.KeyPurpose
    Bases: interlockledger_rest.enumerations.AutoName
    Enumeration of the purpose of keys in IL2.
    Action = 'Action'
    ChainOperation = 'ChainOperation'
    ClaimSigner = 'ClaimSigner'
    Encryption = 'Encryption'
    ForceInterlock = 'ForceInterlock'
    InvalidKey = 'InvalidKey'
```

```

KeyManagement = 'KeyManagement'
Protocol = 'Protocol'

```

KeyStrength

```

class interlockledger_rest.enumerations.KeyStrength
    Bases: interlockledger_rest.enumerations.AutoName
    Enumeration of the strength of keys.

    Normal = 'Normal'
        RSA 2048

    Strong = 'Strong'
        RSA 3072

    ExtraStrong = 'ExtraStrong'
        RSA 4096

    MegaStrong = 'MegaStrong'
        RSA 5120

    SuperStrong = 'SuperStrong'
        RSA 6144

    HyperStrong = 'HyperStrong'
        RSA 7172

    UltraStrong = 'UltraStrong'
        RSA 8192

```

NetworkProtocol

```

class interlockledger_rest.enumerations.NetworkProtocol
    Bases: interlockledger_rest.enumerations.AutoName
    Enumeration of the network protocols.

    HTTPS_Proxied = 'HTTPS_Proxied'

    Originator_Only = 'Originator_Only'

    TCP_Direct = 'TCP_Direct'

    TCP_Proxied = 'TCP_Proxied'

```

NetworkPredefinedPorts

```

class interlockledger_rest.enumerations.NetworkPredefinedPorts
    Bases: enum.IntEnum
    Enumeration of the default ports of the IL2 networks.

    MainNet = 32032

    MetaNet = 32036

    TestNet_Apollo = 32020

    TestNet_Janus = 32022

```

```
TestNet_Jupiter = 32030
TestNet_Liber = 32018
TestNet_Minerva = 32024
TestNet_Neptune = 32026
TestNet_Saturn = 32028
```

RecordType

```
class interlockledger_rest.enumerations.RecordType
    Bases: interlockledger_rest.enumerations.AutoName
    Enumeration of the types of Records available in IL2.
    Closing = 'Closing'
    Corrupted = 'Corrupted'
    Data = 'Data'
    EmergencyClosing = 'EmergencyClosing'
    Root = 'Root'
```

1.2.4 interlockledger_rest.util module

LimitedRange

```
class interlockledger_rest.models.LimitedRange(start, count=1, end=None)
    Bases: object
```

A closed interval of integers represented by the notation ‘[start-end]’. If the range has only one value, the range is represented by ‘[start]’.

Parameters

- **start** (*int*) – Initial value of the interval
- **count** (*int*, optional) – How many elements are in the range
- **end** (*int*, optional) – If defined, define the end value of the interval

Raises *ValueError* – If ‘count’ is 0

start

int – Initial value of the interval

end

int – End value of the interval

__contains__ (*item*)

Check if item is in self.

Parameters *item* (*int/LimitedRange*) – Item to check if is in self.

Returns Return item in self.

Return type *bool*

__eq__ (*other*)

bool: Return self == other.

```

__hash__()
    int: Hash representation of self.

__str__()
    str: String representation of self.

count
    int – Number of elements in the interval.

overlaps_with(other)
    Check if there is an overlap between the intervals of self and other.

    Returns Return True if there is an overlap.

    Return type bool

classmethod resolve(text)
    Parses a string into a LimitedRange.

    Parameters text (str) – String representing the range in the format of '[start]' or '[start-end]'.

    Returns An instance of the LimitedRange represented by the text.

    Return type LimitedRange

```

null_condition_attribute

```
interlockledger_rest.models.null_condition_attribute(obj, attribute)
```

Return the value of the item with key equals to attribute.

Parameters

- **obj** (dict) – Dictionary object.
- **attribute** (str) – Attribute name of obj.

Returns The value of the item. If obj is None, return None.

filter_none

```
interlockledger_rest.models.filter_none(d)
```

Remove items of a dictionary with None values.

Parameters *d* (dict) – Dictionary object.

Returns Dictionary without None items.

Return type dict

string2datetime

```
interlockledger_rest.models.string2datetime(time_string)
```

Convert a string to datetime object. The format of the string is as follows: 'yyyy-mm-ddTHH:MM:SS+HH:MM'.

Parameters *time_string* (str) – string with date and time.

Returns date time object.

Return type datetime.datetime

to_bytes

`interlockledger_rest.models.to_bytes(value)`

Decodes value to bytes.

Parameters `value` – Value to decode to bytes

Returns

Return the value as bytes:

if `type(value)` is `bytes`, return `value`;

if `type(value)` is `str`, return the string encoded with UTF-8;

otherwise, returns `bytes(value)`.

Return type `bytes`

INDICES AND TABLES

- `genindex`
- `modindex`
- `search`
